Computer Networks**

Assignments

Marks: 15

1. 16-bits even parity Hamming code with single bit error whose binary value is 0110101100110010110101 arrives at the receiver. How many parity bits are required to ensure that the receiver can detect and correct single bit error? What is the original binary code?
2. Describe a way to reassemble IP fragments at the destination. Consider that the fragments may arrive out of order and some may be missing during the transmission.
3. In a LAN, Which MAC protocol has a higher efficiency: ALOHA or CSMA-CD?
4. Identify the address class of the following IP addresses: 200.58.20.165, 128.167.23.20, 16.196.128.50, 150.156.10.10 and 250.10.24.96
5. A small organization has a class C address for 7 networks each with 24 hosts. What is an appropriate subnet mask?

Submit the assignment before 26/05/2025.
