

CLASSES AND OBJECTS

- A class is a user-defined blueprint or prototype from which objects are created. It represents the set of properties or methods that are common to all objects of one type.
- Using classes, you can create multiple objects with the same behavior instead of writing their code multiple times. In general, class declarations can include these components in order:
 - **Modifiers:** A class can be public or have default access
 - **Class name:** The class name should begin with the initial letter capitalized by convention.
 - **Body:** The class body is surrounded by braces, { }.

- **Example:** A Car represents a class (blueprint), while BMW, Mercedes, and Audi represent objects (instances) created from that class.

Access Modifiers for Classes or Interfaces in Java

- Access modifiers in Java are used to control the visibility of the variables, classes and methods within a class or package.
- The access modifiers strictly enforce the level of accessibility and these are defined by different keywords.
- There are 4 types of access modifiers available in Java
